

DUNFORD ROYAL CATTLE COMPANY

BLACK ANGUS BULL SALE

APRIL 2, 2011 @ 6:00PM

CARSON'S AUCTION SERVICE, LISTOWEL, ON

Welcome to the Dunford Royal Bull Sale. We have the best set of bulls which we have ever raised and we think you will be pleased when you appraise the offering. At DRCC we are working to be one of the major Black Angus seedstock producers for both the purebred and commercial breeders in Canada. We may not be one of the largest purebred herds however not many can match the intensity of our operation. As you look thru the pedigrees of the animals in our offering you will notice we use mostly proven sires and that the depth of breed leading genetics is unequalled. Many of these bulls are from our ET program and they are AI sired, which contributes to the consistency and predictability of these future herd sires. We have used every tool available to measure the performance and body composition of these bulls to better predict what they can do for your program.

These bulls are developed for longevity. They are grown on a high roughage ration to promote soundness and to help maintain their condition when they are working for you. The fall born bulls are raised on grass with a limited amount of grain thru the summer and fall. The bulls run on a large field all winter and are never pushed. Average Daily Gain (ADG) is calculated from the time they are weaned until yearling weights are taken. They never go thru a test period with heavy feed to achieve extremely high gains. Therefore, they do not have to go through a melt down when they go to work like real cattle.

"REAL CATTLE FOR REAL PEOPLE"

Stan Dunford

This group of bulls will sell ready to go out and service your cows. All of the bulls have been treated this spring for internal and external parasites and have been vaccinated with Cattlemaster 4 + L5 and Covexin 8. They sell with our normal guarantee - if something is not right we will figure out a way to fix it. If you cannot make it sale day we will do our best to send you a bull which will fit your needs - if you are not completely satisfied, you do not own the bull.

We really hope that you can see this set of bulls, either at the sale or anytime before. They are the type that the industry is demanding - thick made, meaty cattle which are efficient to feed and raise. Feel free to call anytime.
We hope to visit with you sale day.

EPD'S

BW	WW	YW	MA	TM	%IMF	REA	FAT
+0.6	+38	+71	+24	+43	+0.15	+0.24	-0.006

- These Forte sons are the calving ease specialists
- Positive maternal traits throughout his pedigree
- Eye catching phenotype with visible soundness

Expected Progeny Differences

Expected Progeny Differences (EPDs) are statistics generated for individual cattle through national genetic evaluations.

EPDs:

- allow breeders to estimate a young animal's breeding value – that animal's value as a parent
- allow a fair comparison of breeding value by removing environmental bias such as climate, feed and special management
- the best tool available to compare animals between herds, countries and year of birth
- help breeders make informed decisions regarding breeding stock selection by evaluating numerous traits such as growth-related traits (BW, WW, YW, Milk), carcass (REA, FAT, %IMF, etc.) and reproductive efficiency (CE, MCE, SC)
- estimate the group performance of one parent compared to the group performance of another parent, assuming similar mates

EPDs evaluate group averages and offspring's performance. They can not predict individual performance or weights.

For example, if Bull A (weaning weight EPD of +10) and Bull B (WW of +60) were randomly mated with ten similar cows, we would expect the group average weaning weight of Bull A's offspring to be 50 lbs lighter than that of Bull B's (60-10=50).

Calf	A	B
1	500	400
2	510	450
3	520	500
4	530	550
5	540	600
6	560	600
7	570	650
8	580	700
9	590	750
10	600	800
Avg.	550	600

Note that not all calves from Bull B have a higher weaning weight but the average is 50 lbs higher.

Accuracy – reflects the reliability of the EPD value. High accuracy values (>.80) mean the EPD value is closer to the true breeding value than an EPD value with a lower accuracy (<.20).

To evaluate seedstock, use EPDs, pedigree and visual assessment. With EPDs, the concept of “intermediate optimums” works best. Selection for one trait or for extremes generally results in unexpected consequences due to genetic correlations – for example, intense selection for high yearling weight will also increase birth weight. Successful cattle breeding requires a thoughtful and balanced approach to optimize fertility, growth and carcass merit while improving profitability and efficiency.

EPD'S 101

Presented by Kajal Devani of the Canadian Angus Association. The presentation will be from 3:00 - 4:00 before the start of the sale.

She will be presenting a program and answering any questions about understanding EPD's and using them in your breeding program.
